 - = *A. castroviejoi* Talavera & Sánchez-Gómez, Anales Jard. Bot. Madrid 67: 42. 2010. **Holotype:** Spain, Murcia, Lorca, Alcoluche, 780 m, 2.5.2009, *D. López, P. Sánchez-Gómez, J.F. Jiménez & J.F. Mota* (SEV; iso: MUB, SEV).

Figures: BONNIER, Fl. compl. ill. France, Suisse, Belgique vol. 3: pl. 144, fig. 781. 1914; TALAVERA, S. & al., Anales Jard. Bot. Madrid 67: 43, fig. 1 (as *A. castroviejoi*). 2010.

Plants unbranched or branched at the base, covered with white, at the nodes, stipules and in the inflorescence also with black hairs 0.3–1.9 mm. *Stems* 4–36(–50) cm, prostrate to ascending, finely sulcate, covered with appressed to ascending, sometimes also with spreading hairs, often more densely toward the nodes. *Stipules* green, (2.5–)3–6(–7) mm, narrowly triangular, acuminate or sometimes long cuspidate, adnate to the petiole for 0.8–1.5(–2) mm, otherwise free, densely white hairy, with black hairs mixed in. *Leaves* 2–7.5(–9) cm; petiole 0.2–1 cm, like the rachis covered with appressed to ascending hairs. *Leaflets* in (5–)7–11 pairs, narrowly elliptic, 2.5–10(–16) × 1.5–3.5(–5) mm, obtuse

to slightly retuse, on both sides appressed hairy, mostly more densely on underside. *Peduncles* 2–11.5 cm, hairy like the stem but more densely and with more black hairs toward the raceme. *Racemes* rather densely 4–11(–15)-flowered. *Bracts* membranous, 1.5–3(–3.5) mm, narrowly triangular, whitish white and black hairs. *Flowers* subsessile. *Calyx* campanulate, 5–7 mm, covered with appressed to subappressed white and black hairs; teeth subulate, 1.5–3(–3.8) mm. *Petals* yellow or violet. *Standard* (5.5–)7–10(–11) × 2–4 mm, narrowly elliptic, emarginate, contracted into a narrow claw. *Wings* (5–)6–8 mm; blades narrowly oblong, obliquely bilobed to nearly rounded, (2–)3–4 × c. 1 mm; auricle 0.8–1 mm, claw (2.5–)3–4 mm. *Keel* (4–)5–6 mm; blades obovate-triangular, with widely curved lower edge and slightly curves upper edge, acute, 1.5–2 × 1–1.3 mm; auricle minute, claw (2–)2.5–3 mm. *Stamen-tube* truncate at the mouth. *Ovary* sessile or subsessile, hairy; style short, glabrous. *Legumes* sessile or with a stipe up to 1 mm, star-like spreading or obliquely erect, narrowly ovate, straight or slightly upcurved, rounded and very slightly widened at the base, 10–15 mm long, 2.5–3 mm high and 3–4 mm wide, keeled ventrally, deeply and narrowly grooved dorsally, with a short and nearly straight beak or with an upcurved to nearly hooked beak 1–2 mm, bilocular; valves coriaceous, covered with two kinds of hairs (double indumentum); densely with short appressed hairs 0.05–0.2 mm and more loosely with ascending to spreading, sometimes curved hairs up to 1.9 mm. *Seeds* 4–7 in each locule, 2–3 × 1.5–2 mm, brown, smooth.

Flowering time: 1–6. *Distribution:* Portugal; Spain (incl. Mallorca); France; Italy; Canary Islands; Morocco; Algeria; Tunisia; Libya; Egypt; Turkey (Ankara, Antalya, Burdur, Kütahya).

Map: GAZER, M., Sendtnera 1: 134, map 18. 1993.
